You are developing an application that will run as an Azure API
App. The application tracks flights between airports, including
duration of flight, if the flight was on time, the capacity of
the airplane, and the number of seats sold. Queries can be
performed to show multiple routes, multi-leg journeys, and
filtering based on the attributes of the flight.
Flight information will be used by customers to perform data
mining, drive interactive display, perform airspace tracking,

and other applications.
Customers require that the response time of the API be as low
as possible, both for retrieving information for a single
flight, and for queries across flights. To achieve the required
level of performance, each API invocation must be satisfied by
a single operation against the data store containing flight
information.
You need to implement the data store for this application.
Solution: You use Cosmos DB.
Does the solution meet the goal?
A. Yes
B. No
Answer: A
