NEW QUESTION: 3
Your Azure Machine Learning workspace has a dataset named . A sample of the data in the dataset follows.

You want to use automated machine learning to find the best

regression model for predicting the price column.
You need to configure an automated machine learning experiment
using the Azure Machine Learning SDK.
How should you complete the code? To answer, select the
appropriate options in the answer area.
NOTE: Each correct selection is worth one point.

Answer:
Explanation:

Explanation

Box 1: training_data
The training data to be used within the experiment. It should
contain both training features and a label column (optionally a
sample weights column). If training_data is specified, then the
label_column_name parameter must also be specified.
Box 2: validation_data
Provide validation data: In this case, you can either start
with a single data file and split it into training and
validation sets or you can provide a separate data file for the
validation set. Either way, the validation_data parameter in
your AutoMLConfig object assigns which data to use as your
validation set.
Example, the following code example explicitly defines which
portion of the provided data in dataset to use for training and
validation.
dataset = Dataset.Tabular.from_delimited_files(data)
training_data, validation_data =
dataset.random_split(percentage=0.8, seed=1) automl_config =
AutoMLConfig(compute_target = aml_remote_compute, task =
'classification', primary_metric = 'AUC_weighted',
training_data = training_data, validation_data =
validation_data, label_column_name = 'Class') Box 3:
label_column_name label_column_name:
The name of the label column. If the input data is from a
pandas.DataFrame which doesn't have column names, column
indices can be used instead, expressed as integers.
This parameter is applicable to training_data and
validation_data parameters.
